

Project	Américo Vespucio East
Type of Initiative	Public
Location	Metropolitan Region
Investment:	US\$ 1.969 million
	<p>In order to extend a high level of service to the entire Americo Vespucio ring road, there are plans to improve the stretch that runs from Grecia Ave. in the South to El Salto Ave. in the north, approximately 13 km that would become part of the Urban Highway System operating in the Metropolitan Region.</p> <p>The lack of continuity in the service levels causes major traffic jams in eastern Santiago at different times of day, causing significant losses from a social point of view and environmental pollution from gas emissions and noise, unlike the other stretches that have already been tendered, where the speed of circulation is fluid and the traffic congestion and environmental pollution have been minimized.</p> <p>The road project contemplates providing the service level of a concessioned urban highway, which will consider 3 express lanes in either direction, local or service roads, road safety elements, an electronic toll collection system, variable signposting, and a communication and customer service system; in other words, a standard with the same characteristics as the other urban roads under concession.</p> <p>The concessionaire's income will be obtained from the tolls users are charged.</p>
